

Feature Implementation Convention

> Standard format for all feature implementation documents across TrueSight DAO's digital infrastructure. This convention applies to every project: autopilot, tokenomics, dapp, market_research, go_to_market, dao_client, and all others.

1. Why This Convention

Problem

Feature implementations across the DAO have been documented inconsistently. Some documents start with technical details, others with context, others with a checklist. This makes it hard for:

- **Governors** to quickly understand why a feature exists
- **Developers** to understand how to implement it
- **AI agents** to parse and act on the plan
- **Future maintainers** to understand design decisions

Vision

Every feature implementation in the DAO follows a single, predictable structure:

1. **Why** — the problem, vision, and success criteria
2. **How** — the implementation details, architecture, and design decisions
3. **When** — the execution roadmap with concrete checkpoints

This consistency reduces onboarding time, eliminates ambiguity, and makes every document machine-readable by AI agents.

Success Criteria

- Any governor can open any implementation document and find the "Why" in the first section
- Any developer can open any implementation document and find the technical details in the second section
- Any AI agent can parse any implementation document and extract actionable tasks from the third section
- Every .md has a corresponding .pdf in Saffron Monk style

2. Implementation Details

2.1 Document Structure

Every feature implementation document MUST have exactly three sections, in this order:

...

[TITLE]

> [One-line summary / tagline]

1. Why

Problem Statement

[What problem does this feature solve? What pain point exists today?]

Vision

[What does success look like? How does this serve the DAO's mission?]

Success Criteria

[Measurable outcomes — how will we know this is done?]

2. Implementation Details

Architecture / Design

[How does this work? Key components, data flow, integrations.]

Key Decisions

[Design choices and why they were made. What alternatives were considered?]

Risks & Mitigations

[What could go wrong and how will we handle it?]

Dependencies

[What needs to exist before this can be built?]

3. Execution Roadmap

Phase 1: [Name]

- [] Task 1 — [owner]
- [] Task 2 — [owner]
- [] **Checkpoint:** [what success looks like at end of this phase]

Phase 2: [Name]

- [] Task 1 — [owner]
- [] **Checkpoint:** [what success looks like at end of this phase]

Phase N: [Name]

- [] Task 1 — [owner]
- [] **Checkpoint:** [what success looks like at end of this phase]

...

2.2 Section Rules

Section 1: Why

- Must be the first content section after the title and tagline
- Must include a problem statement grounded in current reality
- Must include a vision that ties back to the DAO's mission (10,000 hectares of Amazon rainforest)
- Must include concrete, measurable success criteria
- Should reference existing context files where relevant

Section 2: Implementation Details

- Must describe the architecture or design at a level appropriate to the audience
- Must document key design decisions and alternatives considered
- Must identify risks and mitigations
- Must list dependencies (people, systems, credentials, data)
- Should include diagrams or data flow descriptions where helpful
- Should reference relevant runbooks, API docs, or schema files

Section 3: Execution Roadmap

- Must be a checklist with - [] items
- Must be organized into phases
- Must have a checkpoint at the end of each phase (what "done" looks like)
- Should assign owners to tasks where known
- Should include estimated effort or time where possible
- May include links to related PRs, issues, or documents

2.3 File Naming

- Use SCREAMING_SNAKE_CASE.md for implementation documents
- The .pdf version uses the same base name
- Store in the relevant project's docs/ directory or the project root
- Cross-project features go in agentic_ai_context/

2.4 PDF Generation

Every .md implementation document MUST have a corresponding .pdf generated using the Saffron Monk style (see PDF_STYLE_CONVENTION.md).

Workflow:

1. Write the .md file
2. Generate the .pdf using the generate_pdf tool
3. Commit both files in the same PR

3. Execution Roadmap

Phase 1: Establish Convention (this PR)

- ☒ Create FEATURE_IMPLEMENTATION_CONVENTION.md
- ☒ Create PDF_STYLE_CONVENTION.md (extracted from generate_pdf tool)
- ☒ Generate .pdf versions of both documents
- ☐ **Checkpoint:** Both documents merged to agentic_ai_context main branch

Phase 2: Retroactive Compliance

- ☐ Audit existing implementation documents across all repos for compliance
- ☐ Update top-priority documents to match the new convention
- ☐ **Checkpoint:** All active implementation documents follow the convention

Phase 3: Enforcement

- ☐ Add a PR checklist item: "Does this feature have an implementation document following FEATURE_IMPLEMENTATION_CONVENTION.md?"
- ☐ Add a GitHub Action or autopilot check that validates new implementation documents
- ☐ **Checkpoint:** Convention is automatically enforced
