

USA Production — Chocolate Bar Production Specification

For: Santos (Brazil production) — via Fatima Toledo **From:** Gary Teh · TrueTech Inc **Re:** Recurring conversion of Agroverse cacao into finished 81% chocolate bars for the USA market **Status: PLANNING PHASE — do not begin production.** Draft requirement spec for Fatima to review with Santos.

⚠ Planning phase only — please do not execute yet

Fatima — this is a planning document, not a production order. Please share it with Santos so he can review feasibility, capacity, and pricing, **but he should NOT begin producing anything yet.**

We are still waiting on **last year's bars to arrive in San Francisco** so we can **inspect their condition** (survival of transit, quality, shelf state). Only after that inspection will we know whether this recurring arrangement is viable. This spec defines

what it would look like if we proceed

— it is for alignment and quoting, not a green light.

1. Purpose

This document is the **requirement specification** for a proposed recurring chocolate production arrangement between TrueTech Inc and Santos, supplying the **USA market**. Fatima Toledo relays this to Santos as the definition of what we would need him to produce, what we supply, and what he returns to us on each cycle.

Bars are **81% cacao, 50g**, in the Cabrellon mold — the same format Kirsten produces in San Francisco.

Note on volume visibility. We expect to gain USA-side visibility by observing how the current freight pallets pan out on arrival. This spec sets a **standing per-batch target of 100 kg of finished chocolate (≈2,000 bars)** so Santos can plan capacity around a fixed, predictable cycle. Actual per-cycle quantity may be confirmed ahead of each batch.

2. Product specification

Attribute	Specification
Product	Dark chocolate bar
Cacao content	81% cacao / 19% cane sugar — two ingredients only, nothing else
Bar weight	50 g per bar
Mold	Cabrellon Italian polycarbonate — 27.5 × 17.5 cm, 4 cavities × 50 g (supplied by us)

Attribute	Specification
Finished-chocolate target per batch	100 kg
Bar count per batch	≈ 2,000 bars (2,000 × 50 g)
Internal wrap	Food-grade foil — provided by Santos, holds each bar
External packaging	Agroverse-branded — provided by us to Santos at the time of production

The recipe is **two ingredients only** — **81% cacao and 19% cane sugar, nothing else**. The cacao percentage may be adjusted in future cycles once we have market feedback. **81% is the current standing recipe.**

Cabrellon Italian polycarbonate mold (27.5 × 17.5 cm, 4 cavities × 50 g) — supplied by us for each cycle.

3. Production cadence

Production would run **twice per year**, aligned to the equinoxes (Brazil):

Cycle	Date (Brazil)	Season
Cycle 1	March 20	Spring Equinox
Cycle 2	September 20	Autumn Equinox

- Cadence: **once every six months** (two batches per year).
- Each cycle produces the standing target of **100 kg / ≈2,000 bars** unless a different quantity is confirmed in advance of the batch.

4. What we supply (each cycle)

Delivered by **Matheus** at the start of each production cycle. Matheus operates **Black King (CNPJ)** and is the **logistics coordinator and exporter for Brazil** — he handles moving the beans and mold to Santos and exporting the finished bars.

Item	Supplied by	Notes
Cacao beans	Matheus / Black King (Agroverse warehouse, Ilhéus)	Enough for the target batch of finished chocolate
Chocolate mold	Matheus / Black King (delivered with the beans)	Cabrellon mold — on loan for the cycle; returned to us
External branding packaging	TrueTech Inc	Agroverse-branded packaging provided to Santos at the time of production

Matheus brings **both the cacao beans and the chocolate mold** each time a conversion is needed. The mold is our property, provided per cycle.

5. What Santos provides

Item	Provided by Santos
Conversion / production labor	Bean-to-bar processing into finished 50g bars
Internal foil	Food-grade foil that wraps and holds each individual bar

Santos provides the **internal foil** only. He does **not** supply the external branded packaging — we provide the Agroverse-branded packaging to him at the time of production for him to apply.

6. Expected output (returned to us each cycle)

At the end of each production cycle, Santos returns:

Output	Quantity / detail
Finished chocolate bars	≈ 2,000 × 81% cacao, 50 g bars (100 kg total), each in internal foil

Output	Quantity / detail
Residue cacao tea	All cacao-tea by-product generated during processing
Chocolate mold	The Cabrellon mold, returned to us at the end of each cycle

All three are expected back each cycle: the finished bars, the cacao-tea residue, and our mold.

7. Commercial reference

Item	Reference
Prior Santos quote	R\$130/kg for 70% bars ; Santos indicated willingness to try 50g bars
This spec	81% cacao, 50 g format — final per-cycle pricing to be confirmed with Santos

Pricing for the 81% / 50g format at the 100 kg cadence should be confirmed with Santos through Fatima. The R\$130/kg figure is a prior reference point (70% bars), not a locked price for this arrangement.

8. Summary — the arrangement in one view

Question	Answer
What	81% cacao, 50g chocolate bars for the USA market
How much	100 kg (≈2,000 bars) per cycle
How often	Every 6 months — Mar 20 & Sep 20 (equinoxes, Brazil)
We provide	Cacao beans + mold (via Matheus / Black King) + Agroverse-branded packaging delivered at production time
Santos provides	Production labor + internal foil
Santos returns	≈2,000 finished bars + cacao-tea residue + our mold

9. Open items to review with Santos (via Fatima)

These are for review during the planning phase — not a production start.

1. **Viability gate** — pending inspection of last year's bars once they arrive in San Francisco. No production begins until that inspection confirms the approach works.
2. **Capacity confirmation** — could Santos meet 100 kg (≈2,000 bars) within a single equinox cycle?
3. **Pricing** — per-cycle price for the 81% / 50g format at 100 kg volume.
4. **Foil** — confirm Santos sources food-grade internal foil suitable for 50g bars.
5. **Lead time** — how far ahead of each equinox must beans + mold arrive for on-time completion?

6. **Mold count** — whether one Cabrellon mold is sufficient for the throughput, or additional molds are needed to hit 2,000 bars per cycle.
