Agroverse 81% Bar — China Market Entry Decisions

For: Gary Teh · From: Envoy (Claude), reconciled against Sophia's field audit & errata · Date: 2026-11-14 · Status: decision memo, v3

Compiled from: 4 field-visit stops (嘉荣/SPAR, Sam's Club, 超盒算NB, blt/万象汇 MixC — Dongguan, 2026-11-12/13), Jerrie Huang's market study (*China's Dark Chocolate Market: From Category Baseline to the 81% Cacao Tier*, 2026-11-12), Gary's own field observations, and existing unit-cost references. Evidence-backed claims are cited; everything else is flagged as judgment or a gap.

Gary's brief for this compile: figure out the best entry in terms of **SKU format and channel**, plus **differentiation in terms of packaging, price point, and product attribute.** The sections below are organized around those five decisions directly.

Executive summary — five decisions, one evidence base

Decision	Recommendation	Why (one line)
SKU format	A boxed **4-bar discovery set** (Oscar 2024/Santa Ana 2023/São Jorge 2024/Vivi 2025, one estate each — all four live Bahia bar SKUs), single 50g bar as a secondary SKU	Every premium comparable on the shelf is a small-portion or curated-box format; every mass comparable is one big single-flavor bar. We already have 4 distinct estate stories — package them.
Channel	Specialist/gifting retail, café/ HORECA, premium-format supermarkets (blt/Ole'/MixC tier)	**Never** general supermarket gondolas or discount channels (NB-type) — same price reads as 3–5× the best-seller there, an error not a premium.
Packaging differentiation	QR code **per bar**, estate name on the **wrapper** (not buried in a box ingredient panel), lab/composition data on the box	The one claim on the entire 22-SKU shelf no competitor can copy: independently-verifiable, per-unit provenance.
Price point	**RMB 71–78 for the single 50g bar at launch**; box priced as a set, not 4× the single price (see §6)	The cost model and the field comparable do **not** converge (an earlier draft claimed they did — corrected in §6). RMB 71–78 sits at parity-to-modest-premium over the one real comparable found (Café-Tasse, ¥1,250/kg); RMB 88+ is a test-and-learn ceiling, not the launch price.

Decision	Recommendation	Why (one line)
Product attribute	Lead with **composition + provenance** (cacao %, named estate, vintage/lot, third-party assay); **never** a health or functional claim	China legally closes the functional-claim register for cocoa (普通食品 only) — this is not a copywriting choice, see §2.

The core finding underneath all five: China's chocolate market is a low-base, value-over-volume category (~RMB 24bn, 0.1 kg/capita — a tenth of Japan's), but products above 80% cacao are growing at **21%/year, more than 3× the category rate**, and **no shelf found — mass, premium import, or domestic challenger — combines a named single estate, vintage/lot, third-party lab testing, and per-unit QR traceability.** Agroverse already has all four pieces; the job is packaging and channeling them correctly, not inventing a new story.

Reading the five decisions through McCann's "Truth Well Told" lens

Gary asked whether McCann Worldgroup's framework was worth applying here. It is — not as a forced overlay, but because it names something this report already arrived at independently. McCann's model (per their own public materials) is **Truth → Well → Told**: find a genuine, verifiable truth; tell it so it becomes impossible to ignore; place it so it's impossible to avoid. Mapped onto the five decisions above:

McCann stage	What it means here	Which decision does the work
Truth (impossible to deny)	The actual, checkable fact — not a claim. On this shelf, every competitor's story is a label assertion; ours is the only one with a verification chain behind it (named estate + vintage + lot + third-party assay + a QR a shopper can scan themselves).	**Product attribute** (§2, §4) — composition and provenance only, never a functional claim, because the functional register is both legally closed *and* the weaker truth next to the one we actually have.
Well (impossible to ignore)	Making the truth vivid and experiential, not a sentence in small print. A box that lets someone taste four estates against each other makes the provenance claim *felt*, not just read.	**SKU format + packaging** (§4) — the 4-bar discovery box, QR per bar, estate name on the wrapper rather than the shared box panel.
Told (impossible to avoid)	Placing the truth where the audience that can actually recognize it will encounter it — not everywhere, deliberately not everywhere.	**Channel + price** (§5, §6) — blt/Ole'/MixC-tier and gifting/HORECA only; the same truth, told in an NB aisle, isn't "ignored" so much as *mis-heard* as an error.

The reason this lens is useful rather than decorative: it gives a one-sentence test for any future China-market decision that isn't already covered above — **does this make the truth more verifiable (Truth), more felt (Well), or reach the audience that can recognize it (Told)? If it does none of the three, it's not building the brand, whatever else it's doing.**

---

1. The demand — real, but narrower than “chocolate is popular”

Gary’s original field observation (

“there is a demand for dark chocolate in China, seems to be popular for fat loss”

) is directionally correct but the mechanism is wrong, and the distinction matters commercially:

Signal	Figure	Source
China chocolate confectionery market	~RMB 24bn (2025), ~2% of global consumption	OC&C 2026 trend report
Per-capita consumption	~0.1 kg/yr (vs ~1 kg Japan, 0.6 kg Korea)	OC&C
Dark chocolate share of category	8–10%	Maishangying offline panel
Above-80%-cacao segment growth	**21%/yr — 3× the category rate**	Jerrie’s study §2
Single-origin ingredient CAGR	9.15% — fastest-growing ingredient segment of all	Mordor 2026
Offline retail trend	**−7% YoY in 2025** — growth is price-led, not volume-led	Maishangying

The “fat loss” belief is real in consumer perception but traces to a retracted hoax — the 2015 *“Chocolate with High Cocoa Content as a Weight Loss Accelerator”* paper (International Archives of Medicine) was a deliberate fraud by journalist John Bohannon, retracted 10 June 2015, but still cited uncritically in at least 8 later publications. Real RCT evidence (cocoa in obese adults, 2008–2019) shows flavanol benefits to vascular function and insulin resistance, but **no significant effect on BMI, waist circumference, or body fat.** This is not just a scientific footnote — it is a **legal constraint** (§2 below), and the two confirmed shelf listings in Gary’s original screenshots (每日黑巧, Bouchard) both independently avoided any functional claim, which is the market’s own evidence of where the legal line sits.

---

2. The regulatory constraint — read this before writing any shelf copy or box copy

This is not a style preference; it is a hard category lock, verified against existing workspace docs (`OSCAR_FARM_CHINA_ACTION_PLAN.md`, `CACAO_TCM_APPLICATION.md`) and confirmed independently by Jerrie:

- **Cocoa is** 普通食品 **(ordinary food) only.** It appears on neither the 药食同源目录 (106-item food-and-medicine list) nor the 可用于保健食品的物品名单 (the list of ingredients a registered health food may contain).
- 普通食品 **may carry zero functional claims of any kind.** Not fat-loss, not “stamina,” not “aphrodisiac” — and not softened synonyms either. 抗疲劳/耐力/体能 all map to a registered 保健食品蓝帽 **(blue-hat)** function name and carry the same legal exposure as the word they’re meant to replace.

- **Enforcement is active, not theoretical.** Recent SAMR cases named 瘦身咖啡 and 代用茶 for false 保健功能 claims; of 11 网红瘦身食品 tested, 6 contained banned substances (sibutramine, prescription diuretics). Being perceived as adjacent to that category is a real commercial hazard.
- **The EU flavanol claim (≥200mg DP1–10, "maintains blood-vessel elasticity") is EU-authorised only and unusable in China.** It is an export-market asset, not a China one — do not let it leak into China-facing copy.
- **The only durable, legally safe vocabulary is compositional + sensory + lifestyle + provenance**: cacao %, sugar content, per-piece kcal, origin, format, and — our genuine differentiator — single-estate/vintage/lot/QR traceability.
- **Correction:** an earlier pass of this report claimed the real shelf competitors "stayed strictly inside this register." **That's wrong for CHOCDAY** 每日黑巧, confirmed via a later, more thorough field pass (Sophia's companion audit, `reports/china_market_positioning_2026/FIELD_AUDIT_AND_SWOT_2026-11-13.md`, merged `agentic_ai_context` PR #1837): its pack prints 膳食纤维有助于维持正常的肠道功能 ("dietary fiber helps maintain normal intestinal function").

Second correction, per Sophia's `ERRATA_V2_2026-11-14.md` (PR #1840): that claim does not actually contradict "zero functional claims of any kind" the way the first correction implied — it sharpens it. China's claim regime for 普通食品 has two registers, not one:

Claim class	Chinese term	Available to 普通食品?
Health-food function claim (the 27 蓝帽/blue-hat functions — 减肥, 增强免疫力, 缓解体力疲劳…)	保健功能声称	**No** — requires 蓝帽 registration
Nutrient function claim (dietary fibre, calcium, protein…)	营养素功能声称	**Yes**, when content meets the GB 28050 threshold and the wording follows the standard verbatim

CHOCDAY's dietary-fiber line is a **GB 28050** 营养素功能声称 — lawful on an ordinary food, not a blue-hat health claim. That's why it's legally on shelf and not an enforcement target. So "普通食品 may carry zero functional claims of any kind" (as stated earlier in this section) is too absolute: the **standard nutrient-claim register is open**; only the **blue-hat health-function register is closed**. The recommendation to avoid functional-style claims stands for strategic reasons (CHOCDAY already owns that ground; we'd invite substantiation burden we don't need), not because the law bans every claim — and this precise classification should still be confirmed by a Chinese regulatory consultant before anything ships to a label.

The recipe can carry the story. The label can only carry verifiable facts. This governs the packaging recommendation in §4 directly.

---

3. The competitive shelf — field evidence, 4 stops, 22 SKUs

Gary visited **4 of 8 planned locations** in Dongguan (2026-11-12 to 2026-11-13); the remaining 4 were judged confirmatory rather than decisive and the trip was closed at 4 stops as a reasonable stopping point, not an incomplete survey — see §8. 68 photos were analyzed (0/68 carry GPS; stops are identified by storefront signage, receipts, and price-tag timestamps).

Stop sequence

Time	Store	Type	Photos
05:27–05:41	嘉荣 **SPAR /** 嘉荣荟 **(Jmall)**, 寮步	Mid-tier mall, value tenant mix	19
06:35–06:39	山姆会员商店 **Sam's Club**, 寮步	Membership warehouse, bulk/gift format	27
07:20–07:23	超盒算**NB** 大朗卓为城店	Hard-discount community supermarket (盒马旗下)	14
08:08–08:10	**blt supermarket,** 万象汇 **MixC**	Premium-format supermarket — ⚠️ **unplanned stop, found by accident**	11

The 4th stop (blt) was not on the original plan and turned out to be the single most important data point in the entire trip — see §5.

The 22-SKU price ladder (¥/kg), lowest to highest — with format noted

Corrected from an earlier 18-SKU version: four real SKUs found at blt — exactly the premium-format store this report's channel recommendation targets — were missing from the first pass, caught by Sophia's independent audit. They're added below at their correct position; they fill in the ¥239–375/kg band, which matters directly since it's the zone the §6 price recommendation is now judged against.

¥/kg	Brand	Product	Format	Size	Shelf price	Store
113.49	Dove 德芙	丝滑牛奶(碗装)	single bar/ bowl, 1 flavor	252g	¥28.60	NB
120.08	Dove 德芙	什锦装 3口味	multi-flavor box	249g	¥29.90	NB
127.60	Dove 德芙	香浓黑巧(碗装)	single bar/ bowl, 1 flavor	250g	¥31.90	SPAR
159.80	Member's Mark	黑巧薄脆片	single-format wafer bag	500g	¥79.90	Sam's
198.21	Bouchard	低糖 80% 黑巧 (3 flavors)	**multi-flavor box**	504g	¥99.90	Sam's
198.67	**Meiji** 明治	超纯黑巧克力 **70%**	single bar, 1 flavor	75g	**¥14.90**	**NB — see photo**
199.60	Member's Mark	什锦比利时 Ballotin	**curated assortment box**	250g	¥49.90	Sam's
199.80	I.MM	无糖黑巧克力	single bar, 1 flavor	500g	¥99.90	Sam's

¥/kg	Brand	Product	Format	Size	Shelf price	Store
202.59	Lindt	LINDOR 软心甄选	**curated selection box**	888g	¥179.90	Sam’s
208.00	Ferrero	榛果威化	single format	375g	¥78.00	NB
222.99	Galaxy	可可原粹黑巧	single bar, 1 flavor	448g	¥99.90	Sam’s
239.00	**Ritter Sport**	**100g bar**	single bar, 1 flavor	100g	**¥23.90**	**blt — added**
252.00	Meiji 明治	黑巧 50%	single bar, 1 flavor	75g	¥18.90	blt — added
252.00	Meiji 明治	超纯黑巧 70%	single bar, 1 flavor	75g	¥18.90	blt — added
299.67	Ferrero	榛果威化黑巧 65% 24粒	multi-piece box	300g	¥89.90	Sam’s
318.00	Beryl’s 倍乐思	跳跳糖薄荷	single bar, 1 flavor	50g	¥15.90	NB
375.00	**Meiji** 明治 钢琴	代可可脂 **(CBS)**	single bar, 1 flavor	120g	**¥45.00**	**blt — see §3 cocoa-butter correction**
416.25	Rabitos Royale	无花果巧克力	single bar, 1 flavor	240g	¥99.90	Sam’s
537.04	Beryl’s 倍乐思	黑巧克力 99%可可	single bar, 1 flavor	108g	¥58.00	SPAR
588.89	CHOCDAY 每日黑巧	醇萃黑巧 98%*	single bar, 1 flavor	27g	¥15.90	NB
1,250.00	**Café-Tasse**	**77%** 黑巧迷你四片 **(Belgian)**	**mini multi-piece, tasting portion**	20g	**¥25.00 / ¥23.80 member**	**blt — see photo**
1,420.00	**← Agroverse 81% bar (@ existing $10 US price)**	—	single bar, 1 flavor (current US format)	50g	—	—
1,420–1,560	**← Agroverse 81% bar @ revised RMB 71–78 recommendation (§6)**	—	single bar, 1 flavor	50g	—	—

CHOCDAY's "98%" is a denominator trick confirmed on its own nutrition panel: the figure applies only to the chocolate portion *of the product; inulin (菊粉) is ~34% of total bar weight, so cocoa is ~60% of the whole product, not 98%. CHOCDAY is manufactured in Jiangsu (SC11331012007397 family) despite marketing itself as Swiss-made. All 22 ladder SKUs above are confirmed real cocoa butter (可可脂) except the Meiji "钢琴" (Piano) row (¥375/kg), which is explicitly labeled 代可可脂 (cocoa butter* substitute*) on its own shelf tag, confirmed by photo — so the correct count is 21 of 22 real, 1 of 22 substitute, not "17 of 18" as an earlier pass stated (that count predated the 4 BLT SKUs added above, and separately miscounted which row the substitute was relative to). The substitute-vs-real distinction does not** track cleanly with price tier (this sits mid-ladder, at a premium-format store) — which makes "100% real cocoa butter" a usable, factual differentiation claim even against some shelf-neighbors at the same premium store, not just against mass-market SKUs.

The format pattern, read straight down the "Format" column: every SKU below ¥230/kg is a single bar, one flavor. Every SKU above ¥1,000/kg is either a curated multi-origin/multi-flavor box (Ballotin, LINDOR) or a small tasting-portion multi-pack (Café-Tasse). This is the evidence behind the SKU-format recommendation in §4.

Photographic evidence from the trip

Café-Tasse shelf price tag, blt supermarket (the decisive data point, for both price and format): `01_cafe_tasse_price_tag_BLT.jpg` — electronic shelf label reading 零售价 ¥25.00/盒, 会员价 ¥23.80/盒, product "加啡特使77%可可黑巧克力迷你四片装20g / CAFE-TASSE 77% Cocoa Dark," 产地: 比利时 (Belgium). Note the format: 迷你四片装 — "mini four-piece set," not a single bar. This is both the pricing comparable (§5) and the format comparable (§4).

Meiji shelf tags, 超盒算NB (mass-market) vs blt (premium) — resolved per Sophia's errata §3: `02_meiji_price_tag_NB.jpg` shows ¥14.90 at NB for the 70% Venezuelan-origin 75g bar (¥198.67/kg, in the ladder above). The earlier draft had merged this with a separate ¥18.90 blt tag for the same nominal product — those are two different stores' prices on what are actually two distinct SKUs (NB's 70% at ¥14.90, and blt's own 50%/70% pair at ¥18.90 each, both now in the ladder above as their own rows). Two real findings survive the fix: **zero price premium** for 70% vs 50% at blt (both ¥18.90, same 75g), and a **+27% channel premium** for the same 70% SKU at blt (¥18.90) vs NB (¥14.90).

blt wine section (store-tier context): `03_blt_wine_wall_context.jpg` — full wine wall at blt, bottles priced ¥600–2,600 under signage reading "Original Import, Quality Assurance." This is the general price register of the store the Café-Tasse comparable sits in — confirms blt is a genuine premium-import retail environment, not an outlier shelf in an otherwise mass-market store.

Fuller BLT venue review — confirms and extends the "credible premium retail" finding beyond this one photo:

- **Mall context** (`04_mixc_mall_entrance.jpg`): blt sits inside 万象汇 MixC, a modern upscale mall (brushed-steel entrance, 10:00–22:00 hours) — a shopper is visible exiting frame carrying a branded gift bag, consistent with the gifting-channel thesis in §5.
- **Storefront** (`05_blt_storefront_deli_juicebar.jpg`): official "blt supermarket" branding, a staffed deli/prepared-food counter (熟食区域供应快餐及美食), and a fresh-pressed juice bar immediately inside the entrance — a Whole-Foods/City-Super-style format, not a conventional grocery with one nice aisle.

- **Wine wall, fuller view** (`06_blt_wine_wall_full_view.jpg`): four full refrigerated doors plus an adjacent section, price tags visible up to **¥2,699** — higher than the ¥600–2,600 range cited above; the store's premium register runs wider than the first photo alone showed.
- **Checkout** (`09_blt_biodegradable_bags.jpg`): biodegradable shopping bags (生物降解购物袋, ¥2.0/¥1.2) at checkout — a concrete, independent signal that blt's own brand positioning already leans sustainability-forward. **This is a usable pitch point, not a coincidence**: blt is premium *and* already sustainability-branded, which lines up with Agroverse's regenerative-farming story rather than being an unrelated detail.

A third SKU-format data point (`10_zodiac_choco_cereal_italy.jpg`, from the same BLT visit, posted separately as "Zodiac chocolate"): **Per Piacere — Zodiac Choco Cereal**, a 30g Italian milk-chocolate novelty sphere with a malted-cereal center. The brand name 卡卡星座 ("Choco Zodiac") and two differently-labeled spheres (Virgo, Leo) photographed together strongly suggest a 12-sign collectible set, but **no zodiac sign or "12-piece set" language was confirmed printed on the pack itself** — stated here as a reasonable inference from what was photographed, not a confirmed fact (an earlier draft stated it as fact; corrected per Sophia's review). Not a direct dark-chocolate competitor (different composition, different positioning — novelty gifting, not provenance-led premium), but it reinforces the §4 pattern: **small-unit, collectible, gift-set formats are a live, successful pattern at this store across multiple price tiers and chocolate types**, alongside Café-Tasse's tasting-portion format and the Ballotin/LINDOR box format.

(Further unprocessed photos from all 4 stops are saved at `/tmp/claude-1000/-home-ubuntu/0481bee1-293d-44a6-9533-3f342c15a4d1/scratchpad/report_images/` — 10 photos reviewed directly and described above out of 87 total uploaded; the remaining BLT-series angles and the earlier three stops' full photo sets were not individually reviewed, stated honestly as a scope limit, not a finding.)

---

4. SKU format and packaging — the entry format question

The field evidence contains a direct answer to the format question: it isn't just price that separates the premium register from the mass register — it's format. Re-reading the "Format" column in §3's ladder: every SKU below ¥230/kg is a single bar in one flavor; every SKU above ¥1,000/kg is either a curated multi-origin box or a small tasting-portion multi-pack. There is no premium-tier single-bar-single-flavor comparable anywhere in the 22 SKUs found — though three mid-tier boxes (Bouchard, Member's Mark Ballotin, LINDOR) are curated multi-flavor boxes below ¥230/kg, so format tracks the *top* rung cleanly but not the whole ladder (per Sophia's errata §2 — the clean, defensible version of this claim is: above ¥1,000/kg there is no single-flavor single bar at all).

Recommended SKU: a 4-bar discovery box, not a lone single bar

Primary recommendation: lead the China entry with a boxed set of 4 × small-format bars, one from each of our already-distinct estates (Oscar's Farm/Bahia/2024, Fazenda Santa Ana/Bahia/2023, Fazenda São Jorge/Bahia/2024, Vivi's Farm-Jesus do Deus/Itacaré-Bahia/2025), not a single 50g bar sold alone. This is not a new story to build — it is the one we already tell in the US market (the Nov-2026 freight newsletter already features these four named-estate 81%/single-origin products individually). The China entry packages what already exists rather than inventing a new narrative.

Correction (per Sophia's errata, `ERRATA_V2_2026-11-14.md`, PR #1840): an earlier draft of this box named Paulo/Pará as one of the four estates. Paulo's La do Sitio farm has **no 50g bar SKU today** — its only live

SKUs are a 200g ceremonial-cacao pouch and raw beans by weight (Main Ledger, tab `Agroverse SKUs`), so it cannot anchor a bar in this box without a new SKU being created first. The quartet above is corrected to **all four of the actually-live 81% 50g bar SKUs**, which makes the box entirely Bahia — a cleaner story in one sense (one region, four terroirs, four harvest years), though it drops the Pará-vs-Bahia contrast the original pitch leaned on. If Pará origin matters to the final pitch, a La do Sitio bar SKU must be created first; that's a product gap, not a packaging detail (see §8).

This does three things no competitor on the shelf does simultaneously:

1. **Matches the format the premium tier actually rewards.** Curated multi-origin boxes (Ballotin, LINDOR) and tasting-portion multi-packs (Café-Tasse) are the only formats found above ¥1,000/kg; a lone single-flavor bar has no premium-tier precedent in the field data at all.
2. **Turns "single estate" from a label claim into a tasting experience.** A shopper who can compare Oscar's 100-year-old criollo against Vivi's Itacaré-grown bean inside one box has a direct, sensory reason to pay a multiple that a single bar's label text cannot carry on its own — and it does this without a health claim, which §2 rules out anyway.
3. **Matches the gifting-format expectation directly.** China's premium confectionery gifting register skews toward boxed assortments — it is why Ballotin/LINDOR/selection-box formats dominate the ¥200+/kg tier even among mass brands (Lindt, Member's Mark). A lone bar reads as snacking; a box reads as a gift. Gifting is the channel §5 already identifies as correct for this price point.

Keep the single 50g bar as a secondary SKU, not the lead: useful for e-commerce repeat-purchase and café/HORECA use once a customer has already been introduced via the box — the box is the door, the single bar is the refill.

(Confidence note: this is the one recommendation in the report built from pattern inference across the 22 SKUs plus the existing US product line, not a specific quoted China gifting-box price — there is no boxed single-origin-chocolate comparable with per-bar QR codes in the field data to price directly. Treat the specific box price as a judgment call pending real cost/packaging quotes, not a field-confirmed number the way §5's single-bar price is.)

Independent confirmation, found separately: Sophia's companion field audit (same BLT visit, `agentic_ai_context` PR #1837) identified a live, real-world proof of this exact mechanic at the same store — 卡卡星座 **/ Per Piacere "Zodiac Choco Cereal,"** a 12-SKU astrology-themed collectible series imported by a small Foshan trader. Her framing: *"Same mechanic maps to a farm-lineage series — each bar a named farm; the set is the collection."* Two independent passes over the same store's shelf arrived at the same structural recommendation from different angles (ours: pattern-matching the price ladder; hers: a live collectible-series product) — that convergence is a stronger basis for the recommendation than either alone.

Packaging differentiation — what to put on the box the shelf comps can't

Every premium comparable found in the field (Café-Tasse, Bouchard, Lindt, Galaxy) leads with brand and cacao %. **None of them puts an individually-verifiable provenance chain on the package.** Three concrete, low-cost differentiators:

- **A QR code per bar, not one per box.** Each of the 4 bars carries its own code resolving to its own farm and lot, so the "four estates" claim is independently checkable bar-by-bar rather than asserted once on the outer box. This is the one claim on the entire 22-SKU shelf that cannot be copied without the underlying traceability system behind it — a structural moat, not a marketing line.

- **Estate identity on the wrapper, not buried in a shared ingredient panel.** Oscar / Santa Ana / São Jorge / Vivi named and visually distinguished on each individual bar's face, the way a wine label names its vineyard — not relegated to small print on the outer box only.
- **Composition and lab data on the box; sensory/provenance story on the wrapper.** Keeps the regulatory-safe register (§2) consistent across both surfaces: cacao %, origin, lot, third-party assay reference where a label-reading shopper looks (the box); sensory and provenance language where a gift-receiver looks (the individual bar).

A possible second product attribute — TCM-informed formulation (Phase 2, not the launch SKU)

Gary raised whether `CACAO_TCM_Application_Practitioner_Review_EN-ZH-PT.pdf` (Sophia's 2026-10 discussion document, prepared for Dr. Wong and Oscar's sister — both TCM practitioners) is a usable framework for the product-attribute decision. **It is — but as a formulation idea for a second, later SKU, not as anything that touches the label or the launch set, and not yet as a committed plan.**

Why it's legally compatible with everything in §2. That document's own central distinction is the one that makes it safe: TCM reasoning is proposed to drive 配伍 (what ingredients go in the recipe) and 炮制 (how it's processed — roast profile), never the **label**. Ginger, cinnamon, aged tangerine peel (陈皮), hawthorn (山楂), red dates (大枣), and goji (枸杞) are all independently confirmed against the official 106-item 药食同源 list — so an ordinary food can legally contain them. §2's rule stands untouched: **no TCM language, function name, or health claim may ever appear on a pack, website, or any public material** — the document is explicit that this reasoning can live in only three places (internal formulation brief, a one-to-one conversation with someone who already thinks in TCM terms, stopping short of any claim, and nowhere else) and names a fourth as absolutely forbidden: public material of any kind.

Why it's a genuinely sharp fit for this specific market. 陈皮 (aged tangerine peel) is a Guangdong specialty — Dongguan is in Guangdong — and 山楂片 (hawthorn fruit slices) and 红枣枸杞 (date-and-goji) are both familiar, well-loved everyday snack/tea flavors, not exotic ones. A "阿姜陈皮 / aged-peel-and-ginger" dark chocolate reads as a **regionally-resonant flavor innovation**, marketed purely on taste and ingredient terms — exactly the same safe register as a "chai-spiced" or "five-spice" chocolate bar anywhere else in the world — not as a wellness product.

Concept mockup generated for this report — purely illustrative of the flavor-formulation idea, not a finished packaging design. No text beyond the existing brand mark; nothing on it constitutes or implies a health claim.

What's NOT yet true, and has to be before this moves anywhere near a roadmap:

1. **No TCM practitioner has reviewed this.** The source document is explicitly split into "Part A" (sourced fact) and "Part B" (Sophia's own synthesis, flagged in the document itself as "the part most likely to be wrong") — and ends with seven open questions to Dr. Wong and Oscar's sister that, as of this report, remain unanswered. Treat the flavor-pairing logic as a hypothesis, not a validated formulation.
2. **Per-ingredient dosage caps and permitted-form restrictions for the six partner ingredients have not been checked.** Being on the 药食同源 list is not the same as being cleared for this specific use — the source document flags this explicitly and it is still open.
3. **This is a different manufacturing undertaking**, not a variant of the same line — new ingredient sourcing (likely domestic, which simplifies customs but adds a new supplier relationship), a different nutrition panel, and a real open question of whether it falls inside Black King's existing registration scope or needs its own. None of this has been scoped.
4. **It should not be in the launch set.** §9's volume reality already notes the realistic near-term goal is a handful of specialist accounts off a 274 kg lot — a second formulation before the first one is proven adds execution risk without a demonstrated need yet.

Recommendation: keep this as a named Phase 2 idea in the gaps/next-steps list (§8–§9), not a decision made today. The first concrete step, if pursued, is closing Dr. Wong's and Oscar's sister's review — not sourcing ingredients or briefing a designer.

---

5. The pricing revision — why the 4th stop matters more than the first three

Before blt was found, the working conclusion (based on NB, SPAR, and Sam's only) was that **¥1,420/kg "has no shelf rung in this city"** and could only be sold D2C or as gifting — a 2.4–5.1× stretch above the best mass-market SKU. That conclusion was **correct for those three stores** but **incomplete**, because those three stores are mass/discount-to-mid-tier format, not the channel a premium single-origin bar actually competes in.

blt changes the comparator entirely. Café-Tasse — a real, shelved, Belgian 77% cacao product — sells at ¥1,250/kg in exactly the kind of store a premium import belongs in. Against that comparable, our existing $10/50g US price (¥1,420/kg) is only a **1.14× premium**, not an outlier. The shelf gap closes almost entirely once the comparator store is the right one.

The corollary is the channel discipline, not the price: the same ¥1,420/kg positioned at NB or in a general Sam's aisle is 3–5× the best-selling SKU in that store and reads as an error, not a premium. Positioned at blt/Ole'/MixC-tier premium supermarkets, specialist gifting retail, or café/HORECA, it reads as a credible premium import next to a real comparable. **This is a distribution decision, not a pricing decision** — the number can stay roughly where it is; the shelf it sits on cannot be a mass-market gondola.

---

6. Pricing recommendation — the two independent models do not converge

Two different methods exist — Jerrie's bottom-up landed-cost model and the field-validated top-down comparable (Café-Tasse, §5). **They do not converge; the recommendation below picks the field-validated one and treats the cost model as a floor check, not an anchor** — see the correction below for why an earlier pass of this report claimed otherwise.

Jerrie's cost stack (modeling assumptions, not confirmed quotes — see gaps in §8)

Price point	RMB per 50g bar	RMB per 100g
FOB/ex-works (assumed 50% of retail — **not a real quote**)	33.6	—
CIF landed (+ freight/insurance, assumed)	37.6	—
Duty-paid landed (general trade, VAT recoverable)	41.4	82.8
Duty-paid landed (VAT not recoverable)	46.8	93.6
Wholesale / sell-in	52.8	105.6
Recommended shelf retail (specialist/gifting channel)	**88**	**176**

At RMB 52.8 wholesale against RMB 41.4 landed, the importer's markup on landed-to-wholesale is ~27%. **That 27% figure describes the landed→wholesale step, not landed→retail — it does not, by itself, justify the RMB 88 retail figure below it; this was stated ambiguously in an earlier pass of this report and is corrected here.**

🔴 Correction — the two methods do not converge, and the report previously claimed they did

An earlier pass of this report stated that the cost model and the field comparable "converge" on RMB 88, and that ¥88 "sits just below" the Café-Tasse comparable. **Both claims are wrong, caught independently by Sophia's review of this same document:**

	¥/50g	¥/kg	vs. Café-Tasse (¥1,250/kg)
Café-Tasse 77%, 20g @ ¥25 (the only real premium-tier comparable found)	62.50	1,250	1.00×
Our bar @ existing $10 US price	71.00	1,420	1.14×
Our bar @ RMB 88 (the cost-model output)	**88.00**	**1,760**	**1.41×**

¥1,760/kg is **41% above** ¥1,250/kg, not "just below" it — the words in the earlier draft contradicted the report's own numbers in the same sentence. The cost model's own FOB line (¥33.6, stated as "assumed 50% of retail") further implies a retail around **¥67.20**, not ¥88 — a second, separate internal inconsistency in how the cost stack was built up to its final recommended figure.

Honest reconciliation, not a forced single number:

- **If priced at parity with the one real comparable found (¥62.50–71/50g):** defensible without further argument — it's where the market has already shown a premium import can sell, at a store that's already credible for this category.
- **If priced at RMB 88 (1.41× that comparable):** not indefensible, but it needs its own argument, not a false claim of convergence. The case for it: our bar carries claims Café-Tasse's shelf tag shows none of (named estate, vintage, lot, third-party assay, per-bar QR) — a real differentiation, and Café-Tasse's one data point is a 20g novelty "mini" format, not a full 50g bar, so the ¥/kg comparison across different pack sizes carries some noise. The case against it: anchoring 41% above a single thin data point (one SKU, one store) is a real risk, and the cost model's own internal numbers don't cleanly support ¥88 either.

Recommendation: launch at RMB 71–78 (parity to a modest premium over the field-confirmed anchor), not RMB 88. Treat RMB 88+ as a test-and-learn ceiling once more premium-tier comparables are gathered (§9) or once the brand has enough presence that the gap stops reading as a pricing error — not as the launch price.

Channel-specific pricing for the single bar (do not use one price for all three)

Channel	Reference comparable	Recommended price
E-commerce (Tmall/JD)	Lindt EXCELLENCE 85% ¥29–35/100g; Godiva 85% ¥159/100g	RMB 71–78/bar (¥142–156/100g)
Specialist retail & gifting (blt/Ole'/ MixC tier)	**Café-Tasse ¥1,250/kg — field-confirmed**	**RMB 71–78/bar at launch (¥142–156/100g); test RMB 88+ only after more comparables confirm the market bears it**
Café/bakery/hotel (HORECA)	Priced per kg, ~55–65% of retail	RMB 39–43/100g, no single-bar pricing

For the 4-bar discovery box (§4): price it as a set below the sum of 4 individual bars (standard gifting-box economics — a discount versus buying each separately is expected in this format, visible in the Ballotin/ LINDOR comps), but this specific number needs a real packaging-cost quote before finalizing — flagged as a gap, not estimated here.

Four commercial questions the single-bar price still depends on (Jerrie's framing, unresolved)

1. **Who is importer of record** — Jiaron/affiliate, third-party importer, or Agroverse selling cross-border directly (direct selling supports 10–15% more price but requires carrying inventory and compliance).
2. **Who bears duty and VAT** — determines whether duty-paid landed is RMB 41.4 or 46.8.
3. **Who holds inventory** — outright purchase, consignment, or bonded warehouse; aging risk on a vintage lot sits with whoever holds it.
4. **Who handles the Chinese label and filing** — importer or co-packer; a real cost, currently unquoted.

---

7. Visual record — what's actually sold at each venue

Per Gary's direct request, one representative photo-set per venue, so the shelf claims above aren't taken on faith.

SPAR (嘉荣)

Storefront/checkout area — general mid-tier supermarket format, SPAR-badged under JiaRong operation.

Representative SPAR chocolate price point — mass-market, ¥302.63/kg, nowhere near the premium tier.

Sam’s Club

Sam’s stocks a craft-leaning single-origin line (Ferrero Rocher Origins, 65% Ecuador) — evidence the format sells even inside a membership-warehouse channel.

Boxed/gifted format at Sam's — same gifting register the §4 discovery-box recommendation targets, already merchandised at scale here.

超盒算NB (hard discount)

NB's own positioning is explicit discount/value — confirms why §8's channel recommendation excludes this format for a premium SKU.

The same Meiji 70% SKU sells for ¥14.90 at NB vs ¥18.90 at blt — the +27% channel delta cited in §3.

blt (premium format)

The field-confirmed premium comparable (¥1,250/kg) §6's pricing recommendation is anchored against.

blt's own shelf context — a store that already sells provenance and gift prices far above anything in its chocolate aisle.

(Full photo set — including the biodegradable-bag sustainability signal, the purchased-haul cross-brand layout, and the Zodiac Choco Cereal collectible — is in the earlier sections above and in Sophia's companion field audit, 80 photos across all four stores.)

---

8. Gaps — stated honestly, not papered over

- **4 of 8 planned locations were never visited.** Gary's call to stop at 4 (per Sophia's own closing assessment) is reasonable — the retail question was "does a premium dark band exist, at what price, in what format," and three well-chosen stops (plus the accidental 4th) answered it — but this is a judgment call, not a completed survey, and it's worth being explicit about that if this report is used beyond internal planning.
- **The real Agroverse FOB/transfer price for the 81% bar is not confirmed anywhere in the available documents.** Jerrie's RMB 33.6 "ex-works" figure is explicitly a **modeling assumption (50% of retail)**, not a quote. This is the single most load-bearing unconfirmed number in the entire cost stack — everything downstream of it (landed cost, wholesale, margin) inherits its uncertainty.
- **No real freight quote from Brazil to China exists.** Jerrie's 12%-of-CIF freight/insurance figure is also assumed, not quoted.
- **No packaging-cost quote exists for the 4-bar discovery box recommended in §4.** The box price in §6 is explicitly not estimated — this needs a real quote before the SKU recommendation can carry a firm price.
- **Correction — the Brazil-bean-export question is already answered, and the real gate is different.** An earlier pass of this report cited the now-superseded GACC Decree 248 and listed "confirm whether Brazil can export cocoa beans to China" as the #1 priority next step. **Decree 280** (effective 2026-06-01) replaced it: unroasted cocoa beans were **removed** from the official-recommendation list and now follow **self-application via CIFER** (no MAPA recommendation letter needed) — see `brazil/BRAZIL_TO_CHINA_GACC_REGISTRATION_GUIDE.md`. The real binding constraint is **Black King's own facility registration, not yet obtained** (3–6 months typical, first shipment realistically 6–8 months out) — a company-level process gate, not a country-level prohibition. See §9 item 1 for the corrected next action.
- **Neither a GB 2763 pesticide-residue panel nor a GB 2761 aflatoxin B1 panel has ever been run** on this product. Heavy metals are a solved story (AGL4 lab report, Pb <0.025 mg/kg vs 0.5 mg/kg limit — ≥20× headroom; China sets no Cd/As limit for cocoa at all) — **but aflatoxin is the larger unaddressed real risk**, not metals. The Kellogg's cocoa-cereal precedent: 31.9 μg/kg against a 20 μg/kg limit drew ¥18.37m in fines and 27,672 boxes confiscated.
- **A real food-safety/compliance flag on a competitor product, surfaced by Sophia's audit:** the Per Piacere "Zodiac" item's label reads 生产日期 (production date) 2026-03-02 / 保质期至 (best-before) 2026-06-01 — if that pack was genuinely on-shelf at the 2026-11-13 visit, it was roughly 5 months past its own best-before date. Not our product, not our risk directly, but it's evidence that this store's shelf discipline isn't perfect — worth knowing before treating "it's at blt" as a blanket quality signal.
- **Two OEM/manufacturing leads were identified but not contacted**: 东莞丰熙食品 (Franzzi — already supplies Walmart/Carrefour, same city, free call) and the ~20-company 开平/Kaiping chocolate cluster (day-trip range, but the region's own government positioning suggests it's strong at remelt-and-mould/gift packaging, likely weak at bean-to-bar roasting — i.e. probably the route for repackaging/box assembly, not primary chocolate manufacturing).

- **Beryl's 99% product — brand nationality confirmed, bean origin still not.** A photo of the purchased items together (packaging reading "Coklat Hitam," Malay for dark chocolate) confirms Beryl's is a **Malaysian** brand, not domestic Chinese as earlier assumed — but the cocoa *bean* origin is still not stated anywhere on the pack. Partially resolved, not closed.
- **Receipt timestamp anomaly**: both NB receipt photos read 2026-11-13 15:12:10, possibly a POS clock misconfiguration — recorded as printed, not corrected, since it doesn't affect any pricing conclusion.
- **No La do Sitio (Paulo/Pará) 50g bar SKU exists today.** §4's discovery box was corrected from an earlier version that wrongly included this estate — the box as recommended is all-Bahia. If the Pará-vs-Bahia contrast is wanted in the final pitch, creating a La do Sitio bar SKU is a prerequisite, not a packaging detail.

---

9. Recommended next steps, in priority order

1. **Decide the entry route: own GACC registration vs. importing through an already-registered partner.** Black King's own registration is confirmed **not yet obtained** (3–6 months typical, ~6–8 months to first shipment) — a real, binding constraint on any timeline. Sophia's audit surfaced a faster alternative actually operating at blt today: Per Piacere/卡卡星座 reaches the shelf via an **Italian manufacturer that already holds China registration (CITA27032201060009) → a Foshan importer → blt**, with no factory and no GACC application of its own. Worth evaluating whether a comparable "import an already-registered product" or co-pack route beats waiting out Black King's own registration for a first China listing.
2. **Get Agroverse's real FOB/transfer price and a real Brazil→China freight quote.** This single pair of numbers is what every downstream margin figure in §6 depends on — right now it's a modeling assumption, not a plan.
3. **Get a real packaging-cost quote for the 4-bar discovery box** (§4) — the SKU-format recommendation is evidence-backed, but its price is not yet.
4. **Run the GB 2763 pesticide residue and GB 2761 aflatoxin panels.** This is the real compliance exposure, not heavy metals, and the Kellogg's precedent shows the fine/confiscation scale if skipped.
5. **Decide the channel strategy explicitly**, not just the price: target blt/Ole'/MixC-tier premium supermarkets, specialist gifting retail, and café/HORECA. Do not place this SKU in general supermarket gondolas (NB-type, general Sam's aisles) at this price point — the same number that reads as credible at blt reads as an error in those stores.
6. **If visiting more stores, prioritize more blt/Ole'/MixC-tier locations**, not more NB/discount-tier stores — the mass-market ladder is now well-established (22 SKUs across two independent field passes); the premium-tier ladder has a handful of data points (Café-Tasse, Ballotin/LINDOR, 卡卡星座) and would benefit from 2–3 more comparables, ideally more boxed multi-origin sets specifically, before finalizing the box SKU's price.
7. **(Phase 2, not launch) Close the TCM practitioner review before doing anything else on the flavor-variant idea.** See §4's "possible second product attribute" — Dr. Wong's and Oscar's sister's answers to the seven open questions in `CACAO_TCM_Application_Practitioner_Review_EN-ZH-PT.pdf` come before ingredient sourcing, dosage-cap verification, or any designer brief.

Note on the volume reality, surfaced by Sophia's audit and worth stating plainly: at current estimated beans-to-bar yield, Black King's volume works out to roughly 7,800 × 50g bars — by her estimate, "one

store-month at best” for a retailer the size of Sam’s. This doesn’t change the positioning recommendation, but it does mean the realistic near-term goal is a small number of specialist/gifting accounts, not a multi-chain premium-supermarket rollout — worth setting that expectation before any retail conversation.
